No. is the number of results predicted by chance to have a
core greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

This invention relates to the DNA and protein sequences of a novel to the invention relates to the DNA and protein of the invention of its movel burified cratalsee polypetide. The protein of the invention of its monologue is useful for catalysing the breakdown of hydrogen peroxide. The protein sequence of the invention is useful for modifying amail inflectule. The protein of the invention is also useful for catalysing blochemical reactions, for hydrolysing catalysing blochemical reactions, for hydrolysing protein for inkages and for generating antibodies which bind specifically to the protein. The nucleic acid sequences of the convention is useful as a probe to determine whether a blological sample, such as a soil sample, contains an organism having the nucleic acid or such as a soil sample, contains an organism having the nucleic acid or such in contains an organism having the nucleic acid or such in a probable or purify the protein of redertion of protein of the invention is useful in immunosfinity chromatography procedures to isolate or purify the protein or for detection of protein of the invention is useful in immunosfinity chromatography or invention is heat stable, is heat resistant, and is able to the invention and regain activity after exposure to temperatures of from about 60 to 105 degrees. The present sequence represents the but he sequence requesting the protein of the sequence and regain activity after exposure to temperatures of from should be approached the processing sequence represents the but he
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 CCTTTTACCGGAGGTTCGCTTAAGCAAAGTGCAGGTGGCGGCACCAAAAACAGGGTTGG 120

            The invention relates to evaluating strain variation within and between different populations of the tuberculosis becterial pathogen, whose proceed with the propertion of the tuberculosis or talated Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the first strain are positions in the consistence and the correspond to positions that differ in the nucleotide sequences of Mr. tuberculosis strains CDC 1531 (AA19963) and H3TRY (AA19963). The method is useful for evaluation strain variation of tuberculosis and has valuable application in the fields of the tuberculosis spendetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                         other;
                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formet directly from OSPYO ast segate. useboc gov/sequence.html?Docine62942881.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The Invention realtes to a novel method of detecting Mycobacterium tuberculosis. The method comprises amplifying the BNA in the samples to generate a detectable amount of amplified DNA comprising a catalase to percoxide (tatG) DNA fragment with sequence of bases 944-1523 of the M. tuberculosis strain H378 WG katG gene sequence. The method optionally further comprises determining if the katG DNA fragment has a serie to threonine mutation in codon 315 (53157 method). Indicative of an isonicotinic acid hydraxide (IMN) reasistant W. tuberculosis strain. The especially human aputum, useful to diagnose tuberculosis. This disease is a major cause of human morbidity and mortality, and conclusive diagnosis and subsequent treatment depends on identification of the etologic agent W. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IMB-resistant strains have emerged; the method allows such drug-resistant strains to be identified; the present sequence represents the M. tubercollosis kad gene variant.

The method involves the use of restriction fragment length polymorphism (RTEP) analysis to determine if a Ncil-Mspi restriction site is absent in the DNA of the strain at the coden corresponding to codon 450 fg M. tuberculosis katG gene consensus sequence (see ANWI343). The absence of the site indicates an engagement of the strain at the coden while the second set of a M. tuberculosis katG gene an engagement of the strain at the coden while the second second

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       173 GCCGTGGTGGCCCGCGGCTACGCGCCGCTGTTATCCGGATGGCGTGGCA 332
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This partial DNA sequence encodes the ARIC gene from a variant strain of Mycobercarium tuberculosis H37Rv which is used in a novel method to rapidly identify strains of M. tuberculosis which are resistant to rapidly identify strains of M. tuberculosis which are resistant to rapidly identify strains of Form as isonicaterine dead hydrazide). The method involves the use of restriction fragment length polymorphism (RPLP) analysis to determine if a wolf-shelp respirator is strain at the codom corresponding to codom 45 of a M. tuberculosis katch gene consensus sequence (see AAV31343). The absence if he site indicates an IMM-resistant strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGACTGGTGGCCAGCAGATTACGGTCATTATGGCCCCTTCTTTATACGCATGGCGTGGCA 329

Pragments of the gene can be used to identify related sequences. Catalase-64CA2 may be used to catalyse collation reactions such as estardard may be used to catalyse collation reactions such as estardard may be used to catalase collation and the property and the collation with 5 property and production. The connection with 5 property act of production. Nicosensors, connection catalase catalases and pasterisation of dairy products. Antibodies raised against catalase-64CA2 can be used to serven libraries for detection and purification of calls containing the enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to the DNA and protein sequences of a novel to the inveal control and actalase polypetide. The protein of the invention or its homologue is useful for catalysing the breakdown of hydrogen perceited. The protein sequence of the invention is useful for modifying amail molecule. The protein of the invention is amail molecule. The protein of the invention is also useful for catalysing biochemical reactions, for hydrolysing also useful for catalysing biochemical reactions, for hydrolysing specifically to the protein. The nucleat act of sequences of the nucleat ample, such as a soil sample, contains an organism having the nucleat act of such as a soil sample, contains an organism having the nucleat act of solating related nucleic acids. An antibody that binds the cellulase protein of the invention is useful in immunoffinity the culturase protein of the protein of the invention is useful in immunoffinity in the independence to isolate or purity the protein or for detection of protein of invention is beet table, is heat resistant, and is able to the invention and regain activity after exposure to temperatures of from about 60 to 105 degress in his present sequence encoding the hardlegment assumes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New purified catalase polypoptide useful for catalyzing the breakdown of hydrogen peroxide, for modifying small molecules, and for generating antibodies which bind to the polypeptide.
